Calculation of the energy of the bonds and angles between amino acids. In the present paper, the energy of the bonds and angles between amino acids is calculated in the following manner. On the basis of hydrogen-bonding arguments, the energy for a single amino acid is considered to be predominantly a function of the angle of the single amino group in the peptide bond. The energy of the angle is considered to be additive with respect to each element of the amino acid, and the free energy of an amino acid is assumed to be proportional to the energy of the angle between the free amino group and the side group. A library of energy parameters is constructed by fitting the calculated energy to the available experimental data. The calculated and observed values of the energy are in good agreement for all bond and angle energies, and the energy of the angle is shown to be additive over the subunits of the peptide.

Q: Active Directory Authentication I want to authenticate the user to Active Directory using a web service in ASP.NET. Can anyone tell me the best way to do that? I know that I can use System.DirectoryServices and it's objects but I'm looking for a lightweight approach to it. A: To authenticate an Active Directory user against a web application, use an LDAP search against a domain controller (or a non-domain controller machine) on port 389, and look for the last component of the distinguished name (the user account name). The login is based on a pwd attribute (password) and a unique identifier (SID) of the user. The user identifier is stored on the computer that serves as a domain controller. You should be able to get this value by querying an Active Directory for an account that is already logged in. 2d92ce491b
